                                                            규
                                                                      s not known.
C'Superfamily: callular tumor antigen p53
C'Keywords: alternative splicing; phosphoprotein; zinc
F;1-44/Domain: transcription activation #status predicted <TRA>
F;16-26/Region: conserved region I
F;108-121/Region: conserved region II
F;108-121/Region: conserved region II
F;108-121/Region: conserved region II
F;108-121/Region: conserved region II
F;108-121/Region: conserved region IV
F;231-252/Region: conserved region IV
F;331-357/Region: conserved region V
F;313-319/Region: conserved region V
F;313-319/Region: nuclear location signal
F;313-315/Region: tonserved region V
F;313-315/Region: tonserved region V
F;313-319/Region: done in the phosphate (Ser) (covalent) #status predicted
F;7,9,12.18,23,37/Binding site: zinc (Cys, His, Cys, Cys) #status predicted
F;312/Binding site: phosphate (Ser) (covalent) (by cdc2 kinase) #status predicted

Submitted (JAN-1996) to the EMBL/GenBank/DDBJ databases.
Submitted (JAN-1996) to the EMBL/GenBank/DDBJ databases.
FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAA antigen expression, or by repression of Bcl-2 expression (By similarity).
                                                                                                                                                                                                                                                              VLYNFMCNSSCVGGMNRRPILLIVTLETRDGQVLGRRCFEARICACPGRDRKADEDSIRK

Comp. Blochem. Physiol. 1208:675-662(1998).

-I-FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinasses. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bcl-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             BASIC (REPRESSION OF DNA-BINDING).

-! FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bc1-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            BASIC (REPRESSION OF DNA-BINDING).

Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             MEDLINE=99422034; PubMed=10490836;

Vet. Med. Sci. 55:801-805(1993).

J. Vet. Med. Sci. 55:801-805(1993).

-I- FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bcl-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  NUCLEAR LOCALIZATION SIGNAL (POTENTIAL)..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     -:- SUBGNIT: Binds DNA as a homotetramer (By similarity).
-:- SUBCELLULAR LOCATION: Nuclear.
-:- DISRARE: p53 is found in increased amounts in a wide variety of transformed cells. p53 is frequently mutated or inactivated in many types of cancer.
-:- SIMILARITY: BELONGS TO THE P53 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ij

-I-FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bcl-2

"Isolation of CDNAs encoding the p53 tumor suppressor gene in the
"Isolation of CDNAs encoding the p53 tumor suppressor gene in the
Japanese Medaka (Oryzias latipes).";

Submitted (MAX-1997) to the EMBL/GenBank/DDBJ databases.

-! FUNCTION: Acts as a tumor suppressor in many tumor types; induces
growth arrest or apoptosis depending on the physiological
circumstances and cell type. Involved in cell cycle regulation as
a trans-activator that acts to negatively regulate cell division
by controlling a set of genes regulated for this process. One of
the activated genes is an inhibitor of cyclin dependent kinases.
Apoptosis induction seems to be mediated either by stimulation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

The perfect characterization of the woodchuck tumor suppressor, p53, and its interaction with woodchuck hepatitis virus X antigen in The perfect characters of the woodchuck tumor suppressor, p53, and growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases.

Apoptosis induction seems to be mediated either by stimulation of mannear and PAS antigen expression, or by repression of BCI-2

                                                                                                                                                                                                                                                                 The present sequence represents a human p51 protein, which is related to p53 and has cell proliferation requiation and tumour suppression activity. The p51 gene can be used in the investigation, diagnosis and treatment of diseases such as cancer, with which the p53 family cell proliferation regulation is associated. The p51 protein may be used for screening potential agonists and antagonists of its regulatory function, for use as drugs,

The present invention concerns the discovery of a new family of cell regulatory proteins (CRPs) termed the p63 family of proteins, which demonstrate certain sequence identity to known tumour suppressor proteins p53 and p73. It has been observed that the intron-exon organisation is conserved between p73 and p53, and from known exon and intron is conserved between p73 and p53, and from known exon and intron is conserved domain and their intervening identify new members of this gene family using a PCR-based strategy of amplifying 2 exons in a conserved domain and their intervening intron. The human p53 gene was localised to chromosomal position and intron. The human p53 gene was localised to chromosomal position affering at the C-terminus have been designated as alpha, beta and gamma forms, while p63 members differing in the N-terminus are designated as delian and A forms, where the deltan form lacks the transactivation domain. The present sequence represents human p63 isotype TAp63 gamma. D63 was detected in a variety of human and mouse tissue. It demonstrates remarkably divergent activities, such as the ability to transactivate p53 reporter genes and induce apoptosis. Cessation or down-regulation of p63 expression may play a critical role in the process of cervical squamous and p63, and as a critical role in the process of cervical squamous proposed in the process of cervical squamous process of p63 may also be implicated in haematopolasis, muscle wasting (e.g.

                                                                                                      comprising an immunogenic parties of a lung purported of a minimum which have cytostatic activity. The polypeptides and polynucleotides are used in compositions and vaccines to inhibit the development of cancer, especially lung cancer, in a patient. Methods described in the invention can be used to monitor the progression of a cancer by carrying out the detection at subsequent time points and comparing the results from the different time points. CD4+ and/or CD8+ T-Cells isolated from a patient are treated with P2, polynucleotides encoding P2 or antigen presenting development of cancer.

Chimera gene of the p53 family, useful for gene therapy, and treatment of cancer, comprises a transcription activating region and a DNA
                                                                                                                                                       Example 1; Page 30-32; 57pp; Japanese
                                                                                  binding region
```

The present invention relates to a chimera gene of p53 family encoding a transcription activating region, a DNA binding region, and an oligomer formation region of different p53 family proteins. The chimeric gene can be used for gene therapy of p53 variant human tumours, and analysis of the function of the p53 family gene. The present sequence was used in the present invention.

```
The invention describes a method of treating genetically-defined disease associated with chromosomal aberrations yielding oncogenic fusion proteins (I), treating cancerous cells containing (I) in a heterogeneous cell population, treating proliferative diseases associated with mutant protein or cellular protein isoforms (II) dependent on heat shock protein or cellular protein isoforms (II) dependent on heat shock protein or cellular protein disease with chromosomal aberration yielding involving administering HSP90-inhibitor. The method is useful for treating genetically-defined disease with chromosomal aberration yielding oncogenic fusion protein, treating cells containing fusion protein in heterogeneous call population, treating proliferative disease (e.g. rheumatoid arthritisty cancer) associated with mutant protein or cellular protein isoform dispendent on heat shock protein or cellular protein isoform dispendent on heat shock protein or cellular protein in a patient heterozygous for (II). The method is useful for treating a disease e.g. hemantopoletic disorder such as T or B cell ymphoma, chronic myeloid leukaemia (CML), APL, AML, MLL and CMML, or a disease characterised by a solid tumour such as papillary thyroid carcinoma, Ewing's sarcoma. The method is also useful for treating viral infections. This is the amino acid sequence of a human oncogenic protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Treating genetically-defined disease associated with chromosomal aberrations yielding oncogenic fusion proteins, e.g. cell proliferative diseases, involves administering an inhibitor of heat shock protein 90

The invention describes a method of treating genetically-defined disease associated with chromosomal aberrations yielding oncogenic fusion proteins (1), treating cancerous cells containing (1) in a heterogeneous cell population, treating proliferative diseases associated with mutant protein or cellular protein isoforms (11) dependent on heat shock protein (HSP)-90, or selectively treating cells expressing (11) in administering HSP90-inhibitor. The method is useful for treating genetically-defined disease with horromosomal aberration yielding oncogenic fusion protein, treating cancerous cells containing fusion concepenic fusion protein, treating cancerous cells containing fusion or cancer associated with mutant protein or cellular protein la spetient heterograpus for (II). The method is useful contein isoform dependent on heat shock protein (HSP)-90 (e.g. postein isoform dependent on heat shock protein or cellular protein and patient heteroxygous for (II). The method is useful for treating a disease e.g. hhematopoietic disorder such as T or B cell lymphoma, chronic myeloid leukaemia (CML), APL, AML, AML, NHL and CMML, arrithman and selectively a solid tumour such as papillary thyroid

The invention describes a method of treating genetically-defined disease associated with chromosomal aberrations yielding oncogenic fusion proteins (I), treating cancerous cells containing (I) in a heterogeneous cell population, treating proliferative diseases associated with mutant protein or cellular protein isoforms (II) dependent on heat shock protein (MSP)-90, or selectively treating cells expressing (II) involving administering HSP90-inhibitor. The method is useful for treating genetically-defined disease with chromosomal aberration yielding oncogenic fusion protein, treating cancerous cells containing fusion protein in heterogeneous cell population, treating proliferative disease (e.g. rheumatoid arthritis or cancer) associated with mutant protein or cellular protein isoform dependent on heat shock protein (HSP)-90 (e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                p53), or selectively treating cells expressing mutant protein or cellular protein isoform in a patient heterozygous for [II]. The method is useful for treating a disease e.g. haematopoietic disorder such as T or B cell lymphoma, chronic myeloid leuksemia (CML), APL, ALL, AML, NHL and CMML, or a disease characterised by a solid tumour such as papillary thyroid carcinoma, Ewing's sarrooma, melanoma, liposarrooma, rhabdomyosarrooma and synovial sarrooma. The method is also useful for treating viral infections. This is the amino acid sequence of a human oncogenic protein.
                      Treating genetically-defined disease associated with chromosomal aberrations yielding oncogenic fusion proteins, e.g. cell proliferative diseases, involves administering an inhibitor of heat shock protein 90
